

# The ExecutorService Challenge

---

In this challenge, I want you to modify, and enhance, the Shoe Warehouse Fulfillment code you created, from the previous challenge video.

You should use ExecutorService classes, any of the three that I've covered, so use a SingleThreadExecutor, a FixedThreadPool, or a CachedThreadPool, or a combination of these.

You'll use these, instead of managing individual threads, as you did in that previous challenge.

- Add an ExecutorService in the main method, to send orders to the warehouse.
- Add an ExecutorService to the ShoeWarehouse class, which will fulfill orders.

You should create, and fulfill, 15 shoe orders.
