

# Min and Max Challenge

---

All right. So it's time for your next challenge.

This is the minimum and maximum challenge.

So this challenge is similar to the last one in some ways.

# Min and Max Challenge

---

You'll be using an endless loop which:

- Prompts the user to enter a number, or any character to quit.
- Validates if the user-entered data really is a number, you can choose either an integer, or double validation method.
- If the user-entered data is not a number, quit the loop.
- Keep track of the minimum number entered.
- Keep track of the maximum number entered.

If the user has previously entered a set of numbers (or even just one), display the minimum, and maximum number, which the user entered.
