

# Introduction

---

As of this section of the course, I've covered most of the core functionality in Java.

I want to take this moment, to loop back to some topics I didn't cover, or only mentioned in passing.

This is functionality you may find yourselves using daily, and although the topics are less exciting, they're no less important.

In this section, I'll review the Math class, some additional randomization features, and the BigDecimal class.

After this, I'll be talking about date and time topics, covering many of Java's features in the java.time package.

# Introduction

---

This will segue nicely into a discussion about Java's support for Localization and Internationalization.

By the end of this section, you can boast that you know most of Java's core features.

So let's get going.

There's still a lot to cover, and I want to congratulate you for persevering this far!
