

# "The Cloud", servers, clients, and the inner workings of the internet

LECTURE  
SUMMARY

## Covered in this lecture:

*Taught by:*

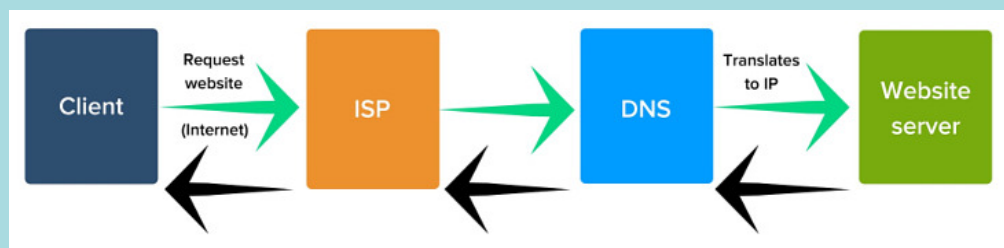

### Explaining how the internet works

#### ► "The cloud" is just a buzz word for the internet

How the internet works:

- Everything is connected to a large network that contains two types of computers:
  - >> Server - stores data in a database and sends it to the client
  - >> Client - something that people use to access the servers
    - examples: laptop, phone, printers, TVs, etc
- Each server has an IP address
- DNS: Domain Name System - it translates website names into IP addresses and back again
