The collect method

The collect method has two overloaded versions.

The first can be used, by passing it the result of any of the many factory methods, on the Collectors class.

I showed you asList, and asSet, as two examples of static methods on that class.

The second is more complex, but gives you ultimate flexibility, as you saw with the TreeSet example I just showed you.

Return Type	Method Parameters
R	collect(Collector collector)
R	collect(Supplier supplier, BiConsumer accumulator, BiConsumer combiner)
